Segezha Packaging starts the warehouse logistic optimization

Segezha Packaging, which consolidates the European paper packaging production facilities of Segezha Group (part of Sistema JSFC) continues the implementation of the digital industrial technologies into the production processes.

As a part of this transformation process, a special SAP module for warehouse management was integrated at Segezha Packaging production plants in Germany and Denmark. The development and implementation was successfully completed by [Serkem](#) company (Germany).

The new module allows to perform every warehouse operation, including arrival of raw materials, processing along the technological chain, storage and shipment, via any operator mobile device (tablet PC or smartphone) and place the corresponding information in the general database. In addition, the integration of the barcode scanners will significantly facilitate the information workflow including shipments status within the facility.

“At both our production facilities in Germany and Denmark warehousing operations have been fully integrated with SAP, and will now be performed quickly and transparently,” said Michael Amann, Manager for Development and Support of Business Systems at Segezha Packaging. *“A simple and intuitive operation algorithm will not require any special knowledge of the SAP platform. The probability of any mistakes has been reduced to a minimum, because less data will be entered manually.”*

Segezha Group is one of the Russia’s largest vertically integrated forest holdings, with a full cycle of logging and advanced wood processing. The Group comprises forest, wood processing and pulp & paper assets in Russia and Europe. The Group has representative offices in 11 countries. Segezha’s products are available in 100 countries of the world. Its enterprises employ 13 thousand people. Segezha Group is the largest forest user in the European part of Russia.
